

# SECURITY - FROM POC TO SOC

sepage. making people love it.

## In Modern security solutions for a modern way of working

Even before the global pandemic starting in 2020, the way we work has been changing fundamentally. A lot of organizations moved to working from home at least partially to provide their employees with more flexibility and the ability to create a better work/life balance. For IT departments, this means completely new requirements in building a secure modern workplace to enable business continuity: the growing number of networked devices requires complex security mechanisms, while simultaneously keeping to internal compliance guidelines and strict data protection obligations. On the other hand, attackers have not been sleeping in the last years and are constantly developing new attack vectors.

From securing endpoints to securing collaboration both with internal and external stakeholders and securing identities in- and outside the cloud, the Microsoft 365 family provides organizations with many answers to the described challenges. As data protection is also an integral part of security, Microsoft Information Protection can strengthen the security posture even further.

## But where to start? And which solutions in which order are the right for you?

Every organization is different. And still there are principles and tools which every organization can leverage for them, like the Zero Trust principles. Following this principle, we at sepage have created a proven way towards the Microsoft 365 Defender suite for our customers. We therefore propose the sepage Security Deep Dives – from PoC to Production.

After discovering the Zero Trust concept, we introduce our sepage Cyber Security Check. This tool is a great way to get a first overview about where on the road towards security you as an organization are today. In several detailed sessions, we will move through all Microsoft Defender solutions and give you a detailed overview about the solution and the corresponding portal. Each session is between 2 and 4 hours long. Combined with a detailed customer assessment, this enables us to create a custom roadmap which shows your way towards the Microsoft Defender solutions.

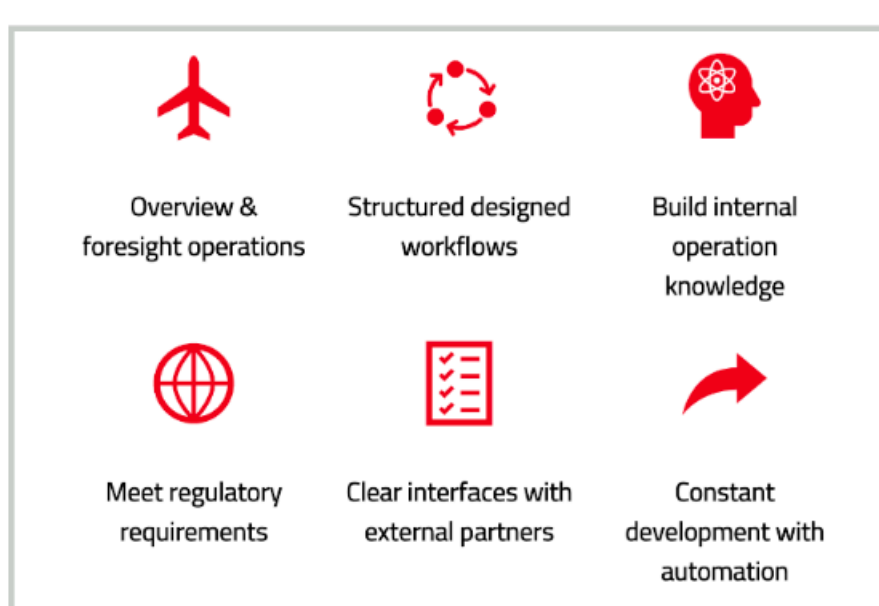

## The detailed combination of Deep Dive sessions can vary from customer to customer, but an example could look like this:

1. Introducing the Zero Trust concept
2. sepage Cyber Security Check
3. Securing endpoints with Microsoft Defender for Endpoint and Microsoft Defender AV
4. Securing collaboration with Microsoft Defender for Office 365
5. Securing identities with Azure AD Premium Plan 2
6. Securing identities with Microsoft Defender for Identity and Microsoft Defender for Cloud Apps
7. Securing data with Microsoft Information Protection
8. New tools, new processes? No issue with sepage adapt!
9. sepage SOC

In the last few years, we experienced that especially Microsoft Security projects do not close the moment all configurations are done. Creating the right processes and being prepared for the worst case is an integral part of those projects! We therefore put special emphasis on the operationalization and creation of processes related to your new security solutions. Based on our experiences from previous customer projects and Microsoft best practices, during sepage adapt together we will build and establish processes to enable your organization to fully use all M365 Defender features. The purpose of the conception and definition of the new processes is a structured "incident handling and remediation" process, as well as perspective implementation in an ITSM or documentation in a "process warehouse" for regulatory purposes. The full potential of the technical security solutions used is leveraged in this module.

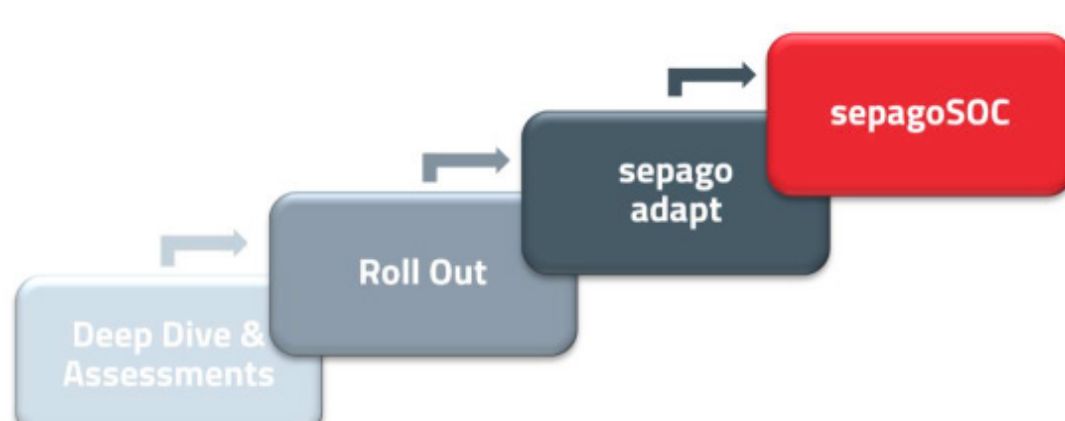

## BENEFITS HOLISTIC APPROACH

The challenge of finding new skilled employees is one which we are all aware of. Our answer to this challenge is sepage SOC. sepageSOC is our offering for Managed Security Services as a complete solution in the Microsoft ecosystem.

Our goal is to ensure the optimal protection of your infrastructure, endpoints, identities, SaaS applications and data through the interplay of always-on advice in the ever-changing cloud world, our deep expertise in securing multi-layered technology and our solid, reliable performance.

With the integrated Microsoft 365 Defender solution, sepage can work with our security experts to piece together the threat signals each of these products receives and determine the full scope and impact of the threat: how it entered the environment and how it is currently impacting the organisation and could do so without remediation.

*"It is important to support the change process continuously and procedurally structured. A holistic view with employees from all affected departments and hierarchy levels ensures a higher level of acceptance and understanding regarding the introduction of Microsoft security solutions."*
